an estimated 4 6 billion years ago the earth and moon were formed in a violent impact on this many agree and even more that a long time after that life began however few know that the first life on the earth may not have emerged on this planet but could in fact have begun on mars brought here by meteorites in this revolutionary book leading scientists peter ward and joe kirschvink rewrite the principal account of the history of life on earth they show not only how the rise of animals was delayed for billions of years but also what it was that first forced fish out of the sea and onto the land together the two scientists explain how developments in the environment led to multiple ice ages before the emergence of dinosaurs and other giant animals and what the true cause of these great beasts eventual extinction was finally charting the course of our own evolution they explore whether this generation will see the end of the human species a new history of life proves not only that much of what we think we know should be unlearned but also that the true history of life on earth is much more surprising and

wonderful than we could ever have imagined

there are few stories more remarkable than the evolution of life on earth this very short introduction presents a succinct guide to the key episodes in that story from the very origins of life four million years ago to the extraordinary diversity of species around the globe today beginning with an explanation of the controversies surrounding the birth of life itself each following chapter tells of a major breakthrough that made new forms of life possible including sex and multicellularity hard skeletons and the move to land along the way we witness the greatest mass extinction the first forests the rise of modern ecosystems and most recently conscious humans introducing ideas from a range of scientific disciplines from evolutionary biology and earth history to geochemistry palaeontology and systematics michael benton explains how modern science pieces the evidence in this vast evolutionary puzzle together to build up an accessible and up to date picture of the key developments in the history of life on earth about the series the very short introductions series from oxford university press contains hundreds of titles in almost every subject area these pocket sized books are the perfect way to get ahead in a new subject quickly our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable

the evolutionary history of life on earth traces the processes by which both living organisms and fossil organisms evolved since life emerged on the planet until the present earth formed about 4 5 billion years ga ago and evidence suggests life emerged prior to 3 7 ga although there is some evidence to suggest that life appeared as early as 4 1 to 4 28 ga this evidence remains controversial due to the non biological mechanisms that may have formed these potential signatures of past life the similarities among all present day organisms indicate the presence of a common ancestor from which all known species have diverged through the

process of evolution more than 99 percent of all species amounting to over five billion species that ever lived on earth are estimated to be extinct estimates on the number of earth s current species range from 10 million to 14 million of which about 1 9 million are estimated to have been named and 1 6 million documented in a central database to date more recently in may 2016 scientists reported that 1 trillion species are estimated to be on earth currently with only one thousandth of one percent described this book is a compilation of high quality articles from the internet

living organisms are astonishingly complex and the more we know about them their biochemistry their anatomy their behaviour the more astonishing are the detailed adaptations that we discover how could this complexity have arisen most of us are familiar with darwin s theory of evolution by natural selection the idea behind it being that in nature those individuals best able to survive and reproduce will transmit the characteristics that enabled them to do so to their offspring leading to the evolution of traits beneficial to the organism although darwin s idea is simple perhaps because it is so simple it is hard to believe that it is able to explain the complexity of the living world we can breed cows that produce more milk compared with earlier generations say but we cannot breed pigs that fly or horses that can talk there would be no promising variants that we could select and breed from where then does the variation come from that has made possible the evolution of ever increasing complexity in the wonderfully adapted organisms we see around us in answering this central question john maynard smith and eors szathmary present for a general readership a novel picture of evolution their basic idea is that evolution depends on changes in the information that is passed between generations and that there have been a number of major transitions in the way that information is stored and transmitted these transitions include the appearance of the first replicating molecules the origin of life itself the origin of cells reproduction by sexual means the appearance of multicellular plants and animals the emergence of cooperation and of animal societies and the unique language ability of humans here then is an accessible account of contemporary biology on the grandest scale from the birth of life to the origin of language containing many original ideas and covering many of the most fundamental ideas in biology this important and deeply interesting book will appeal both to readers with little prior knowledge of science and to biologists themselves
